

METHOD OF TEST
DETERMINING RELATIVE HUMIDITY WITH A SLING PSYCHROMETER
(GENERAL REWRITE)

GENERAL

This method describes how to determine the relative humidity with a sling psychrometer. A psychrometer measures the ambient air temperature (dry bulb temperature) and the wet bulb temperature. From these temperature measurements, the percent relative humidity is determined.

APPARATUS

1. Sling psychrometer

PROCEDURE

1. Before using, take the end cap off the psychrometer and fill the reservoir with water. Be sure that the wick is saturated with water and covers the mercury reservoir on the wet bulb thermometer. Also, be sure that the mercury reservoir on the dry bulb thermometer is dry.
2. Pull the tube clear of the body so that the body can swivel.
3. Hold the tube and whirl the body two to three revolutions per second.
4. Continue whirling until temperatures stabilize (should take 1 to 2 minutes).
5. Stop whirling and immediately read temperature of the wet bulb thermometer and then the dry bulb thermometer.
6. Figure the temperature difference between the two thermometers.
7. Use the attached table to determine the relative humidity.

EXAMPLE

After following the above procedure, a dry bulb temperature of 86°F and a wet bulb temperature of 71°F were obtained. Thus, the temperature difference is 15°F.

From the "Relative Humidity" table, locate the column at the top headed with 15. Follow this column down to the row headed with dry bulb temperature of 86°F. The intersection of the column and the row gives the number 47. This number is the percent relative humidity.

REPORTING RESULTS

Record the time, date, dry bulb temperature, wet bulb temperature, and relative humidity.

Table 1. Relative Humidity, %

Difference Between Readings of Wet and Dry Bulbs in Degrees Fahrenheit.
